

Precision Data Management Packages

Analyze (*Prescribe, Map, Verify, Report*)

The new age of agriculture begins here. This package builds on the visuals and quantities of the previous options and allows modification of rates based on equations and detailed analysis. Good analysis is based upon real results and so we “trust but verify.” Thus, after receipt of your planting data, we will produce maps and visit the field in early spring to inspect emergence based on map data. This inspection will produce geo-tagged images to verify data logged and enable higher accuracy of analysis. This data can be used in subsequent years to construct better crop plans to increase zone fertility, productivity and profitability.

Quantify (*Map & Report*)

The next level in precision agriculture is quantifying the map data. Most growers who want to unlock the hidden information in the maps choose this option. This package includes visuals and adds highly detailed reports that provide solid numbers. Variety performance is measured against soil type, CSR and other variables. Our reports provide numbers coupled with experience, together these will guide a producer to make successful decisions.

Package Includes:

Quantify (Map & Report) Package
Normalized Yield
Planting Prescriptions
Chemical Prescriptions
Spreading Prescriptions
Guidance Patterns
Early Field Data Verification
RTK/Lidar Elevation Data
Drainage Assessment
Crop Meetings/Conference Calls
Fertility Comparison

Visualize (*Map*)

Simply put, this package will take precision data and produce a high quality visual. Our maps utilize vivid colors and provide an outline of each soil type.

Package Includes:

Soil Type and CSR Maps, Tillage Maps, Planting Maps, Application Maps, Harvest Maps

Package Includes:

Visualize (Map) Package
Tillage Report
Planting Report
Application Report
Harvest Report
Crop Summary Report

All data packages supply in-person review consultation and delivery.
